

Chest CT report (practice case)

Patient: PRACTICE-001 Sex: - Age: - Study date: 2026-01-15
Referring: Pulmonology outpatient clinic Modality: CT, non-contrast

CLINICAL QUESTION

Follow-up of a solitary pulmonary nodule seen on a screening study.

TECHNIQUE

Low-dose, non-contrast helical CT of the chest, 1.0 mm reconstructions, lung and mediastinal windows. Coronal and sagittal reformats.

FINDINGS

Lungs: A well-circumscribed, solid nodule in the right lower lobe, approximately 9 x 8 mm, unchanged in size compared with the prior study.

No new nodules. No consolidation, no ground-glass opacity.

Pleura: No effusion, no pneumothorax.

Mediastinum: No enlarged lymph nodes (short axis < 10 mm).

Heart and great vessels: Normal calibre. No pericardial effusion.

Bones: No suspicious lesion. Mild degenerative change of the thoracic spine.

Upper abdomen (partially imaged): Unremarkable.

(continued on page 2)

Chest CT report (practice case) - page 2

IMPRESSION

1. Stable 9 mm solid right lower lobe nodule; no interval growth.
2. No other significant thoracic finding.

RECOMMENDATION

Follow-up low-dose CT in 12 months per the local nodule protocol.

ANNOTATION TASK (for the tutorial)

Outline the right lower lobe nodule on every slice where it is visible.

Use the Paint tool on the axial pane; check the coronal and sagittal panes to make sure the outline is closed in all three directions.

This document is synthetic practice material. It describes no real person.
